

## Grade 8 - Mathematics

### Surface Area and Volume 4

### Memo

1. Calculate the volume and capacity (in *l*) of the following triangular prism.

$$\begin{aligned} V &= (\frac{1}{2}b \times \perp h) \times H \\ &= (\frac{1}{2} \times 4\text{cm} \times 5\text{cm}) \times 8\text{cm} \\ &= 10\text{cm}^2 \times 8\text{cm} \\ &= 80\text{cm}^3 \end{aligned}$$

$$\begin{aligned} \text{C: } 1\text{cm}^3 &= 1\text{ml} \\ 80\text{cm}^3 &= 80\text{ml} \\ 80\text{ml} &= 0,08\text{l} \end{aligned}$$

2. Calculate the volume and capacity (in ml) of the following triangular prism.

$$\begin{aligned} V &= (\frac{1}{2}b \times \perp h) \times H \\ &= (\frac{1}{2} \times 5\text{cm} \times 12\text{cm}) \times 10\text{cm} \\ &= 30\text{cm}^2 \times 10\text{cm} \\ &= 300\text{cm}^3 \end{aligned}$$

$$\begin{aligned} \text{C: } 1\text{cm}^3 &= 1\text{ml} \\ 300\text{cm}^3 &= 300\text{ml} \end{aligned}$$

3. Calculate the volume and capacity (in kl) of the following triangular prism

First work out the height of the  $\Delta$  using pythag

$$(10\text{m})^2 = (\perp h)^2 + (\frac{1}{2} \times 10\text{m})^2$$

$$100\text{m}^2 = (\perp h)^2 + 25\text{m}^2$$

$$100\text{m}^2 - 25\text{m}^2 = (\perp h)^2$$

$$75\text{m}^2 = (\perp h)^2$$

$$\sqrt{75\text{m}^2} = \perp h$$

$$8,66\text{m} = \perp h$$

$$\begin{aligned} V &= (\frac{1}{2}b \times \perp h) \times H \\ &= (\frac{1}{2} \times 10\text{m} \times 8,66\text{m}) \times 6\text{m} \\ &= 43,3\text{m}^2 \times 6\text{m} \\ &= 259,8\text{m}^3 \end{aligned}$$

$$\text{C: } 1\text{m}^3 = 1\text{kl}$$

$$259,8\text{m}^3 = 259,8\text{kl}$$

4. Jerry and his family sell fudge at flea markets. He designed new packaging for the fudge in the form of a triangular prism. The triangular base of the prism has a base of 4,5cm and a perpendicular height of 4,2cm. The Height of the prism is 8cm.
- What is the volume of this packaging?
  - What is the capacity of this packaging in l(round off to the 2<sup>nd</sup> decimal place)?
  - Theoretically, how many pieces of fudge could the box contain if the volume of each piece was 8cm<sup>3</sup> and the fudge was in cubes?
  - Why would this be a theoretical answer and not necessarily a practical answer?

Draw a representation:

- a.  $V = (\frac{1}{2}b \times \perp h) \times H$   
 $= (\frac{1}{2} \times 4,5\text{cm} \times 4,2\text{cm}) \times 8\text{m}$   
 $= 9,45\text{cm}^2 \times 8\text{cm}$   
 $= 75,6\text{cm}^3$
- b. C:  $1\text{cm}^3 = 1\text{ml}$   
 $75,6\text{cm}^3 = 75,6\text{ml}$   
 $75,6\text{ml} = 0,0756\text{l}$   
 $0,08\text{l}$
- c.  $75,6\text{cm}^3 \div 8\text{cm}^3$   
 $= 9,45$   
Theoretically you could fit 9 pieces of fudge in each package
- d. This is theoretical because of the shape of the packaging and the shape of the fudge. There would be gaps on the side because each block of fudge is a cube.
